

Auto Ticket Classification

Customer Journey Map for the caller (student / teacher)

Based on the project's empathy map and requirement analysis.
Team SWTID-2026-4440: Densingh Daniel J (lead), Siva Subramanian M,
Sivananthan S, Sivananaintha Perumal R.

SCENARIO Raising an IT ticket and getting it classified, acknowledged and routed	Enter How does the caller begin?	Engage What does the system do in the core moments?		Exit How does the caller hear back?	Extend What happens after?
Steps What does the caller experience, and how does the system respond?	1. Raise ticket Caller enters only a Caller Name and a Short Description. A new record is created with Category empty.	2. Automatic classification Flow Designer trigger fires on record creation and scans the Short Description for keywords.	3. Category assignment Flow Logic matches Wi-Fi/Network, Projector, Password/Login or Slow/Hanging and sets Category and Subcategory.	4. Notification An automated email confirms the ticket has been submitted.	5. Resolution routing The categorized ticket is available for the right IT team to pick up. The caller waits.
Interactions Who, where and what does the caller touch?	Thing Incident Workflow form in ServiceNow	Thing "Auto Classify School IT Tickets" flow	Thing Update Record action and dependent Category to Subcategory choice list	Thing Send Email action	Thing Assigned Group and Assigned To fields
	Person Caller only; no IT staff needed	Person None. Caller takes no action.		Place Caller's email inbox	Person IT support team
Goals & motivations At each step, what is the caller's primary goal?	Help me log my issue quickly without technical fields	Help me skip choosing a Category myself	Help me get my issue to the right team the first time	Help me know someone has received my request	Help me get my issue fixed without long waits
Positive moments What is enjoyable, productive or reassuring?	Only two fields to fill in	Classification happens with no manual triage by IT staff	Dependent choice fields keep Category and Subcategory consistent	Immediate confirmation email reassures the caller	IT staff spend time resolving instead of sorting
			Both test scenarios (Wi-Fi, Projector) matched as expected		
Negative moments What is frustrating, confusing or time-consuming?	Callers get frustrated by long response times	Tickets without the expected keywords may be misclassified or left unclassified	Only the Short Description is read; the longer Description and attachments are ignored	The email only confirms receipt. There is no later status update.	Pressure on IT staff when tickets spike during exam and admission periods
Areas of opportunity How might we make each step better?	Extend the keyword and category list beyond Network, Hardware, Access and Performance	Add an NLU / ML classifier for free-form descriptions	Also read the Description field, not just the Short Description	Build a caller-facing status page so callers can track tickets without emailing IT	Add SLA tracking, auto-escalation, technician auto-assignment and reporting dashboards
