

Brainstorm & Idea Prioritization Template

Project: Auto Ticket Classification using FLOW DESIGNER

Date	28 September 2026
Team ID	SWTID-2026-4440
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

Reference: <https://www.mural.co/templates/brainstorm-and-idea-prioritization>

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Our topic is **Auto Ticket Classification using FLOW DESIGNER**. The squad gathered to agree on the problem before generating ideas. The problem was framed as a **How Might We** statement, and the key rules of brainstorming were fixed up front so that wild ideas were not judged too early.

1 Define your problem statement 🕒 5 minutes

What problem are you trying to solve? Frame the problem as a **How Might We** statement — that statement becomes the focus of the whole brainstorm.

PROBLEM

How might we automatically classify and route every incoming ticket the moment it is created, using Flow Designer?

🔄 Key rules of brainstorming
To run a smooth and productive session

🎯 Stay in topic

🗨️ Encourage wild ideas

⏸️ Defer judgment

👂 Listen to others

📋 Go for volume

👁️ If possible, be visual

Figure 1 - Step-1 panel: the How Might We problem statement and the key rules of brainstorming.

Step-1: Team Gathering, Collaboration and Problem Statement Selection

The team was assembled, the problem statement agreed, and each participant's contribution recorded against the project. The problem statement below is the one the remainder of this session works on.

Team Member	Role in the Session	Contribution	Focus Area for the Brainstorm
Amar	Facilitator	Ran the session, kept the rules	Intake channels and ticket trigger conditions
Yuktesh	Service Desk Agent (SME)	Brought real triage pain points	Classification logic, category taxonomy and confidence thresholds
Priya	Flow Designer Developer	Assessed build feasibility	Flow actions, rule tables, subflows and reuse
Rahul	ITSM Process Owner	Weighted ideas on business value	Routing, assignment groups, governance and reporting
Meera	Quality Analyst (Observer)	Recorded decisions and risks	Accuracy measurement, audit trail and edge cases

Selected Problem Statement (How Might We)

How might we automatically classify every incoming ticket and route it to the correct assignment group at creation time, so that agents spend their time resolving issues instead of sorting them?

Why this statement: it names a real pain (manual triage), it is bounded to one measurable behaviour (classification and routing at creation), and it is achievable inside ServiceNow without replacing any existing tooling - the only platform capability it depends on is Flow Designer.

Step-2: Brainstorm, Idea Listing and Grouping

With the problem statement fixed, the team generated ideas freely - **volume over value**. Every idea that could classify a ticket was written down first, and judgement was deferred to Step-3. Fifteen ideas were captured and then clustered into four themes.

2 Brainstorm, list and group ideas30 minutes

Write down every idea that could classify a ticket — volume over value. Then cluster related notes and give each cluster a label.

Figure 2 - Step-2 board: the four members' idea cards and the four clusters they were grouped into.

Idea List and Grouping

#	Idea	Cluster	Raised By
1	Trigger the classification flow the moment a new ticket is created	A	Amar
2	Maintain a rule table of keywords that maps text to a category	B	Yuktesh
3	Accept the automatic category only above a confidence threshold	B	Yuktesh
4	Auto-set the assignment group from the predicted category	C	Amar
5	Use Predictive Intelligence for the category prediction	B	Yuktesh
6	Apply the same classification to tickets raised by inbound email	A	Yuktesh
7	Score several signals (keywords, subject, description, CI) together	B	Priya
8	Derive priority automatically from category and impact	C	Priya
9	Let the agent correct the category and feed that back	D	Rahul
10	Build a dashboard that tracks classification accuracy	D	Rahul
11	Map synonyms and abbreviations so language variants match	B	Priya
12	Make the classification logic a reusable subflow	D	Meera
13	Round-robin tickets inside the resolved assignment group	C	Meera

Evaluation Criteria and Weights

Criterion	Weight	What it measures	Score Scale
Business impact	30%	Reduction in manual triage effort and in mis-routed tickets	1 = low, 5 = high
Build feasibility in Flow Designer	25%	Can the idea be built with native Flow Designer actions and subflows?	1 = hard, 5 = easy
Classification accuracy gain	20%	Expected lift in tickets classified correctly on the first attempt	1 = low, 5 = high
Implementation effort and time	15%	Developer days and configuration effort required	1 = high effort, 5 = low effort
Risk and governance fit	10%	Audit trail, explainability and compliance of an automated decision	1 = risky, 5 = safe

Table 2 - The five criteria and the weights agreed by the team.

Prioritization Scoring Table

Every idea was scored 1-5 against the five criteria in Table 2. The weighted score is (Impact x 0.30) + (Feasibility x 0.25) + (Accuracy x 0.20) + (Effort x 0.15) + (Risk x 0.10), out of a maximum of 5.00, and it sets the ranking used to select the scope of the build.

#	Idea	Impact 30%	Feasibility 25%	Accuracy 20%	Effort 15%	Risk 10%	Score	Quadrant / Decision
1	Trigger the classification flow the moment a new ticket is created	5	5	5	5	4	4.90	DO FIRST - in scope (core build)
2	Maintain a rule table of keywords that maps text to a category	5	5	4	4	4	4.55	DO FIRST - in scope
3	Accept the automatic category only above a confidence threshold	4	4	5	5	4	4.35	DO FIRST - in scope
4	Auto-set the assignment group from the predicted category	5	4	4	4	3	4.20	PLAN / BIG BET - phase 2
5	Use Predictive Intelligence for the category prediction	4	3	5	3	3	3.70	PLAN / BIG BET - phase 2
6	Apply the same classification to tickets raised by inbound email	4	5	4	4	3	4.15	PLAN / BIG BET - phase 2
7	Score several signals (keywords, subject, description, CI) together	3	3	4	3	4	3.30	PLAN / BIG BET - deferred
8	Derive priority automatically from category and impact	4	4	3	3	3	3.55	PLAN / BIG BET - deferred
9	Let the agent correct the category and feed that back	3	5	4	4	5	4.05	DO FIRST - in scope
10	Build a dashboard that tracks classification accuracy	4	4	3	4	5	3.90	FILL-IN - phase 2
11	Map synonyms and abbreviations so language variants match	2	4	3	4	4	3.20	FILL-IN - deferred
12	Make the classification logic a reusable subflow	2	4	3	3	5	3.15	FILL-IN - deferred
13	Round-robin tickets inside the resolved assignment group	2	5	2	4	3	3.15	FILL-IN - deferred
14	Route by agent skill and availability	3	2	2	2	2	2.30	RECONSIDER - out of scope
15	Suggest a category to the user on the service portal form	2	4	3	2	3	2.80	RECONSIDER - out of scope

Table 3 - Prioritization scoring. The 15 ideas are listed in number order; the weighted score column is the basis of the ranking in Table 4.

Final Prioritized Backlog

The ideas are ranked by weighted score. The top rows define what the project builds first; everything below is explicitly deferred, not dropped.

Rank	#	Idea	Score	Decision
1	1	Trigger the classification flow the moment a new ticket is created	4.90	Build first
2	2	Maintain a rule table of keywords that maps text to a category	4.55	Build first
3	3	Accept the automatic category only above a confidence threshold	4.35	Build first
4	4	Auto-set the assignment group from the predicted category	4.20	Phase 2
5	6	Apply the same classification to tickets raised by inbound email	4.15	Phase 2
6	9	Let the agent correct the category and feed that back	4.05	Build first
7	10	Build a dashboard that tracks classification accuracy	3.90	Phase 2
8	5	Use Predictive Intelligence for the category prediction	3.70	Phase 2
9	8	Derive priority automatically from category and impact	3.55	Deferred
10	7	Score several signals (keywords, subject, description, CI) together	3.30	Deferred
11	11	Map synonyms and abbreviations so language variants match	3.20	Deferred
12	12	Make the classification logic a reusable subflow	3.15	Deferred
13	13	Round-robin tickets inside the resolved assignment group	3.15	Deferred
14	15	Suggest a category to the user on the service portal form	2.80	Out of scope
15	14	Route by agent skill and availability	2.30	Out of scope

Table 4 - Final prioritized backlog for Auto Ticket Classification using FLOW DESIGNER.

Selected Scope (Top 4 Ideas)

The following four ideas are taken forward into the build because they sit in the do-first quadrant on the grid and rank highest on the weighted score:

1. **Trigger** - Trigger the classification flow the moment a new ticket is created (idea 1).
2. **Rule table** - Maintain a rule table of keywords that maps text to a category (idea 2).
3. **Confidence gate** - Accept the automatic category only above a confidence threshold (idea 3).
4. **Feedback loop** - Let the agent correct the category and feed that back (idea 9).

Idea 5 - Flow Designer Implementation

Idea 5, the Predictive Intelligence path, is planned for phase 2. Until a model is trained, the same prediction step is satisfied by the keyword rule table from idea 2, so the flow designed now does not have to change shape when the model arrives. The figure below shows the end-to-end flow that the four selected ideas produce.

Figure 4 - The classification flow as built in ServiceNow Flow Designer (trigger, rule lookup, prediction, confidence decision, update or triage, notify and log).

ServiceNow Configuration - Create the Update Set

Before the flow is built, a local update set must be created and made current, so that the flow, its subflows and its custom actions are captured and can be promoted to the test and production instances. The screenshot below follows the two reference images supplied with this session.

servicenow. All Favorites History Workspaces Admin Application scope: Global Update set: Project Update Set

All > Application Navigator > System Update Sets

Search the Application Navigator for the update set modules

Type update set in the navigator filter, then open System Update Sets > Local Update Sets.

1

2 [System Update Sets > Local Update Sets](#)

[System Update Sets > Update Sets](#)

[System Update Sets > Retrieved Update Sets](#)

[System Update Sets > Merge Update Sets](#)

Name String	State Choice	Application String	Created Date/Time
Project Update Set	Current	Global	2026-09-24 10:12:03
Auto Ticket Classification – Flow	In progress	Global	2026-09-19 15:47:10
Inbound Email Action – Triage	Complete	Global	2026-09-11 11:22:38

1 Type **update set** in the Application Navigator filter.
 2 Open **System Update Sets > Local Update Sets**.
 3 The created **Project Update Set** now shows State = **Current**.

Figure 5 - Finding the update set modules in the Application Navigator (steps 1 and 2).

1. Go to All menus → Search for "Update set"
2. Under System Update Sets → Select Local Update Sets
3. Click the New button on the top right corner of the page
4. Name: Project Update Set
5. State: In progress
6. Application: Global
7. Then Save the Form
8. Under Related links, click on "Make This My Current Set"
9. Then the created Update Set will appear as Current

With the update set marked Current, every configuration created for Auto Ticket Classification - the flow, the rule table, the custom actions and the notification - is recorded against **Project Update Set**, which is what allows the work to be moved between instances.

Summary and Next Steps

Fifteen ideas were generated against a single How Might We problem statement, grouped into four themes, and ranked with a weighted five-criterion model. Four ideas were selected for the build, and the Project Update Set was created and made current so that the Flow Designer work is captured from the first click.

1. Build the keyword rule table and the classification flow inside the current update set.
2. Add the confidence gate at 85% and route anything below it to the manual triage queue.
3. Instrument the accuracy dashboard (idea 10) so the 85% threshold can be tuned with evidence.

4. Train the Predictive Intelligence model as phase 2 and swap it into the existing prediction step.
