

Problem-Solution fit canvas 2.0

Purpose / Vision: Automatically classify school IT helpdesk tickets the moment they are created, cutting manual triage effort and giving callers an instant acknowledgement, using a simple no-code ServiceNow Flow Designer solution.

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS - Students and teachers who raise IT helpdesk tickets (callers). - School IT support staff who triage, assign and resolve those tickets.	6. CUSTOMER CONSTRAINTS CC - Small IT team with limited technical resources; no scripting expertise. - Callers provide only a Caller Name and a short description; they do not want to fill technical fields such as Category and Subcategory. - Solution must be no-code and easy to maintain and extend. - Limited staff time during exam and admission periods.	5. AVAILABLE SOLUTIONS AS Manual triage - staff read every ticket and pick the category. Pros: simple, no setup. Cons: slow, inconsistent, does not scale. Custom scripting - Cons: hard for non-technical staff to maintain. ML / NLU classifier - Pros: handles free-form text. Cons: complex and beyond the resources of a small school team.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Callers: log issues (Wi-Fi, projector, password/login, slow computer) quickly and know someone is looking into them. IT staff: route each ticket to the right category and team without reading every ticket. - Manual classification is time-consuming and error-prone; Subcategory can end up not matching Category.	9. PROBLEM ROOT CAUSE RC - Tickets arrive as free text, and nothing sets Category/Subcategory automatically at creation. - Classification depends on staff manually reading every ticket. - Subcategory was not linked to Category, so invalid combinations were possible. - Ticket volume grows faster than available staff time. - No built-in instant acknowledgement to the caller.	7. BEHAVIOUR BE - Callers submit a ticket with just a name and short description, then wait for confirmation. - IT staff open each incident, read it, choose Category/Subcategory and assign it to a group. - Most tickets repeat the same keywords: Wi-Fi/Network, Projector, Password/Login, Slow/Hanging.	
3. TRIGGERS TR - A student or teacher raises a new incident (e.g. "WiFi not working in library"). - Ticket volume spikes during exam or admission periods. - Urgent equipment failures such as a projector not turning on.	10. YOUR SOLUTION SL "Auto Classify School IT Tickets" - a no-code ServiceNow Flow Designer flow on a custom Incident Workflow table. - Trigger: Record Created, when Category is empty. - If / Else If logic checks the Short Description for keywords: Wi-Fi/Network, Projector, Password/Login, Slow/Hanging. - Update Record action sets Category and Subcategory automatically (dependent choice fields keep data consistent). - Send Email action confirms the ticket to the caller. - Update Set packages the configuration for XML export and migration. - Tested: "WiFi not working in library" -> Network / WiFi; "Projector not turning on" -> Hardware / Projector.	8. CHANNELS of BEHAVIOUR CH 8.1 ONLINE Callers raise the ticket in the Incident Workflow table on ServiceNow. Callers receive the automated confirmation email. IT staff pick up the classified tickets in ServiceNow. 8.2 OFFLINE Callers report problems verbally to IT staff. Callers walk up to the IT desk when the projector or Wi-Fi fails in a classroom or the library.	Extract online & offline CH of BE	
4. EMOTIONS: BEFORE / AFTER EM Before: Callers - unsure whether the request was received, frustrated by long waits. IT staff - frustrated and pressured by repetitive sorting. After: Callers - reassured by the instant confirmation email. IT staff - relieved, free to focus on resolving issues.
